# **Monitoring Relays** True RMS 3-Phase, 3-Phase+N, Multifunction Types DPC01, PPC01

### **CARLO GAVAZZI**

#### • TRMS 3-phase over and under voltage, phase sequence, phase loss and asymmetry monitoring relay

- Detect when all 3 phases are present and have the correct sequence
- Detect if all the 3-phase-phase or phase-neutral voltages are within the set limits
- Detect if asymmetry is below set value
- Separately adjustable setpoints
- Separately adjustable delay functions (0.1 to 30 s)
- Output: 2 x 8 Å relay SPDT NE
- · For mounting on DIN-rail in accordance with DIN/EN 50 022 (DPC01) or plug-in module (PPC01)
- 45 mm Euronorm housing (DPC01) or 36 mm plug-in module (PPC01)
- LED indication for relays, alarm and power supply ON

## **Product Description**

3-phase or 3-phase+neutral line voltage monitoring relay for phase sequence, phase loss, asymmetry, over and under voltage (separately adjustable set points) with built-in time delay function.

Supply ranges from 208 to 690 VAC covered by three multivoltage relays (ranges over 415 VAC only on the DIN-rail housing).

## Mode of Operation

Connected to the 3 phases (and neutral) DPC01 and PPC01 operate when all 3 phases are present at the same time and the phase sequence is correct. It can be decided whether to monitor upper and lower voltage level of each phase or their asymmetry and tolerance.

Asymmetry is defined as:

max  $|\Delta V_{ph-ph}|$ nom. voltage

when measuring phasephase voltages and as:

> max I $\Delta V_{ph-n}$ I nom. voltage

when measuring phase-neutral voltages.

Tolerance is defined as: max Inom. voltage- V<sub>ph-ph</sub>l

nom. voltage

when measuring phasephase voltages and as:

> max Inom. voltage. - Vph-nl nom. voltage

when measuring phase-neutral voltages.

#### Voltage level monitoring:

if one or more phase-phase or phase-neutral voltage exceed the upper set level or drop below the lower set level, the red LED starts flashing 2 Hz and the respective output relay releases after the set time period.

#### Asymmetry and tolerance monitoring:

if one or more phase-phase or phase-neutral voltage exceed the set levels the red LED starts flashing 2 Hz and the respective output relay releases after the set time period. For both functions, if the phase sequence is wrong or one phase is lost, both output relays release immediately. Only 200 ms delay occurs. The failure is indicated by the red LED flashing 5 Hz during the alarm condition.

#### Example 1

(Mains monitoring - over and under phase-phase voltage) The relay monitors over and under voltage, phase loss and correct phase sequence.

#### Example 2

(Motor monitoring - starting and operating load -asymmetry and tolerance of phase-neutral voltage) DPC01 and PPC01 ensure correct starting and operating conditions. They monitor the voltage level, phase sequence (correct direction of the motor rotation) and asymmetry.

Frequent failures are fuse blowing and incorrect voltage level. In case of fuse blowing the motor regenerates a voltage in the interrupted phase. The relay detects the failure and reacts due to excessive imbalance among the phases.

# Function/Range/Level/Time Setting

Lower knobs:

Setting of delay on alarm

Adjust the input range setting the DIP-switches 3 and 4. Select the desired function setting the DIP-switches 5 and 6 as shown on the left. To access the DIP-switches open the plastic cover using a screwdriver as shown below.

#### Centre knobs:

Setting of upper and lower level or setting of asymmetry and tolerance on relative scale.
